

## Tower 99

### SHORT DESCRIPTION

As part of the high-rise project Tower 99 West in Frankfurt am Main with 4 basement floors, a 17 meter deep excavation pit was created.

### THE PROJECT

A back-anchored, overlapping bored pile wall was planned for the 135 m long watertight construction pit enclosure. The project area on Robert-Mayer-Straße is opposite the Senckenberg Museum and is in the core zone of the so-called Frankfurter Tons. The optimization of the construction pit planning with BBV-multibond® staggered anchors by Implenia Spezialtiefbau GmbH resulted in the following significant advantages:

- Saving of an entire anchor layer (135 anchor units) against pressing water.
- Saving an (anchor) intermediate excavation level.
- Enables an earth lift level of 7 m.
- Savings of approx. 5-6 weeks in total construction time
- No anchor fees for the client

Anchor test forces of up to 1,000 kN were required to implement the statically optimized implementation planning. This means a 2-fold increase in the load-bearing capacity compared to the current empirical values of classic anchor systems in the Frankfurt clay (approx. 500-600kN).

## SERVICES IN DETAIL

Procedure:

- 325 BBV-multibond® multi-strand anchors

## FACTS

---

<b>Location</b>	Frankfurt a.M. , Germany
<b>Status</b>	completed
<b>Start of construction</b>	January 2019
<b>Completion</b>	December 2020
<b>Contracting entity</b>	Implenia Spezialtiefbau GmbH
<b>Planning</b>	Implenia Spezialtiefbau GmbH

---

## SERVICE PROVIDED

Excavation pits
